- Problem: given an integer  $N$ , find its prime factors (**integer factorization**), e.g.,  $15 = 3 \times 5$ .
- **RSA** scheme (public key  $\rightarrow$  private key)

## Practice (5 min)

- [https://github.com/zhangl64/qiskit-shor/blob/main/prime\\_factorization.py](https://github.com/zhangl64/qiskit-shor/blob/main/prime_factorization.py)
- Download the code and test it with multiple numbers
  - $2,764,973 = 37 \times 74,729$
  - $5,436,949 = 29 \times 187,481$
  - $11,346,317 = 3,431 \times 3,307$
- Command: `time python prime_factorization`

1459067680075833232301869393490706352924018723753571643995818710198734

# Shor's algorithm

- The best classical algorithm has complexity  $O(e^{1.9(\log N)^{1/3}(\log \log N)^{2/3}})$  – **sub-exponential**
- Shor's algorithm can solve it in **quantum polynomial** time  $O((\log N)^2(\log \log N)(\log \log \log N))$

Peter Shor

# Intro to Quantum

# Fundamentals—what is quantum computing?

Quantum computing is the use of quantum mechanics (such as **superposition**, **entanglement**, and **interference**) to perform computation.

# Qubits: a gentle introduction

A classical bit can only represent 0 or 1 at a time

# Qubits in **superposition**

= {0, 1}

1 qubit can represent 0 and 1 at the same time, i.e., “superposition”.

# Qubits

- A classical bit can take the value of 0 or 1.
  - A register of  $n$  bits can be one of  $2^n$  states at a time.
- A qubit can be captured as a **superposition**
  - A register of  $n$  qubits can be  $2^n$  different states.

Shor's algorithm has seriously challenged information security based on public key cryptosystems. However, to break the widely used RSA-2048 scheme, one needs millions of physical qubits, which is far beyond current technical capabilities. Here, we report a universal quantum algorithm for integer factorization by combining the classical lattice reduction with a quantum approximate optimization algorithm (QAOA). The number of qubits required is  $O(\log N / \log \log N)$ , which is sublinear in the bit length of the integer  $N$ , making it the most qubit-saving factorization algorithm to date. We demonstrate the algorithm experimentally by factoring integers up to 48 bits with 10 superconducting qubits, the largest integer factored on a quantum device. We estimate that a quantum circuit with 372 physical qubits and a depth of thousands is necessary to challenge RSA-2048 using our algorithm. Our study shows great promise in expediting the application of current noisy quantum computers, and paves the way to factor large integers of realistic cryptographic significance.

# Now or future?

**DON'T PANIC**

- If it was true, are you ready?
- Take action now: replace public-key encryption with **quantum-safe** ones

# Challenge 1

- How to identify all the functions related to public key encryption?
  - OpenVPN has 168,090 lines of code and 500 files

```
10 tests/unit_tests/plugins/auth-pam/Makefile.am
92 tests/unit_tests/plugins/auth-pam/test_search_and_replace.c
16 tests/update\_t\_client\_ips.sh
15 version.m4
168090 total
(base) leizhang@Leis-MBP-14 openvpn %
```

## Challenge 2

- What happens if Kyber is not secure in the future?

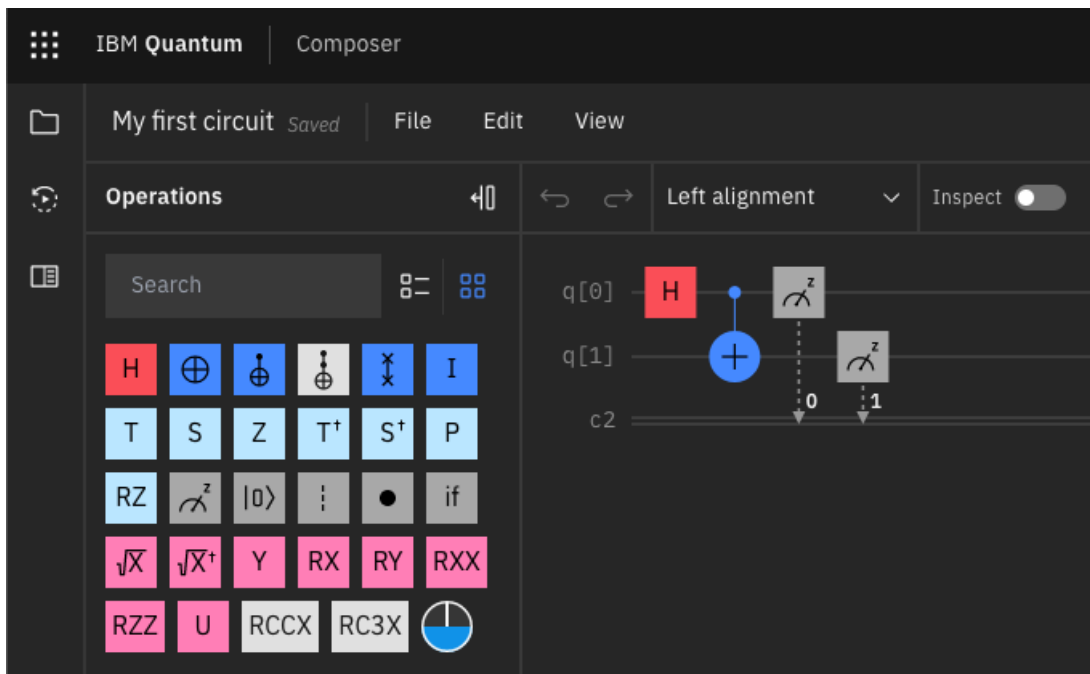

Beyond this lecture...
